

Putting MyPeps on your phone

Nine steps. About ten minutes. Everything is free. You need three files: `index.html`, `manifest.json`, `sw.js` — unzip them first.

1

Make a GitHub account

github.com

Tap Sign up. Email, password, done. Free.

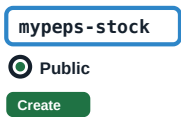

2

Make a new place for the files

The + sign, top right

Tap it, then New repository.

3

Name it

`mypeps-stock`

Leave Public selected. Do not tick Add a README. Tap Create repository.

4

Upload the three files

uploading an existing file

On the next page, tap that blue link.

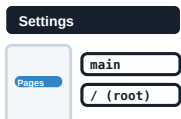

5

Pick the files

`index.html` · `manifest.json` · `sw.js`

Tap choose your files. Your phone opens Files. Find the three, tap each one, tap Select. Scroll down, tap Commit changes.

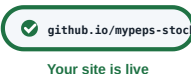

6

Turn the website on

Settings → Pages

Branch: main. Folder: / (root). Tap Save. Wait two minutes.

7

Your address appears

`YOURNAME.github.io/mypeps-stock/`

Open it in Chrome on your phone.

8

Install it

Chrome menu → Add to Home screen

Tap Install. A MyPeps icon appears on your phone.

Allow

9

Allow the camera, once

Press SCAN WITH CAMERA → Allow

It never asks again. Done.

If the file picker will not let you choose all three at once: upload them one at a time. Do index.html first, commit, then use "Add file → Upload files" again for the other two. The result is identical.
